Part two: A) Read the following passage then choose the best answer to the questions below: (2) points each

The brain is the most (complex 1) organ in the (human 2) body. (It 3) produces our thought, action, memory, feeling and experience of the world. The jelly-like mass of tissues, weighs around 1.4 kilograms, contains one hundred billion nerve cells, or neurons. The complexity of the connectivity between these cells is great. Each neuron can make contact with thousands or even tens of thousands of others through tiny structure called synapses. No two brains are alike. It is often said that the right half of the brain is more creative and emotional and the left deals with logic. The two halves have some specializations, the left deals with speech and language, and the right with locations and body awareness. The mid brain and the brain stem control the unconscious functions such as breathing, heart rate, blood pressure, sleep pattern and so on. They also control signals that pass between the brain and the rest of the body through spinal cord.

Part two: A) Read the following passage then choose the best answer to the questions below: (2) points each

Plastic is a material we use every day. We are using (it 1) so fast that the earth's supplies may run out. Because of this, scientists are investigating new ideas for making plastic from plants, such as sweet potato, bamboo and flax. Things made of plastic can be useful but bad for the planet. Some plastics can last for a long time without wearing out and can be (difficult 2) to get rid of when they are not needed. Recycling is a good way to get rid of unwanted products. This can be difficult as different (types 3) of plastic need to be recycled in different ways. Some kinds of plastics can be melted down and used to make things such as bags and bottles. Others can be made into fibers for clothing. The environment is in danger because of plastic, so another way to protect the environment is to use canvas bags for shopping rather than plastic ones.

Part two: A) Read the following passage then choose the best answer to the questions below: (2) points each

Rainbows are multi-colored arcs that are formed in the sky and formed when sunlight shines through the water. As a result, light reflects off the water droplets, bends (called refraction) and splits. When sunlight shines through water droplets, (it 1) splits into seven colors, which is called light spectrum. The outer color of a rainbow is normally red, and the inner color is normally violet. However, sometimes red rainbows are (visible 2) where you only see red light. This can happen at sunrise or sunset when the sun is on the horizon. A rainbow can be a full circle of light. Because you're normally standing on ground when you look at a rainbow, you only see half of it. However, if you were in an aeroplane you would see more of the circle. Sometimes, you may even be lucky enough to see a double rainbow. (Double 3) rainbows are formed when light reflects twice on the raindrops.

Part two: A) Read the following passage then choose the best answer to the questions below: (2) points each

The sun is the largest star in our system. It is a huge star, and the planets orbit around it. The sun is spherical in shape and the scientists state that it contains a mass of hot plasma. The sun is essential for the earth as it gives the earth energy which we (require 1) for the existence of life. The sun is said to have the same age as the solar system. In other words, scientists believe it is four and a half billion years old. The sun basically is a large sphere that glows because it contains hot gases. The (major 2) gases which make up the sun are hydrogen and helium. In other words, it has 70% hydrogen and 28% helium. It also contains other gases like carbon, oxygen and nitrogen. Further, there are other elements like silicon, neon, sulfur and magnesium. The sun is a very bright star (which 3) is four hundred times brighter than a full moon.

Part two: A) Read the following passage then choose the best answer to the questions below: (2) points each

Camels are large mammals that live and work in several deserts. They are known for their humps. The Arabian camel, or dromedary, has one hump on its back. The Bactrian or Asian camel has two humps. The Bactrian camel lives in the highlands of central Asia. The Arabian camel lives mainly in north Africa, the middle east, and India. Camels weigh up to 650 kilograms. They are about 2 meters tall, at the hump. The hump is made of fat and muscles. Camels have long necks, small heads, split upper lips and long eyelashes which (protect 1) the eyes from sandstorms and glaring sun. Camels feed on thorny plants, shrubs and (dried 2) grasses. They can stay for days or even months, without water. If a camel goes without food and water, the fat in its hump can nourish it for several days. Camels can carry up to 450 kilograms. Desert people also drink the camel's milk and eat (its 3) meat. Dried camel droppings are useful as fuel for cooking fires.

Part two: A) Read the following passage then choose the best answer to the questions below: (2) points each

The sun is the largest star in our system. It is a huge star, and the planets orbit around it. The sun is spherical in shape and the scientists state that it contains a mass of hot plasma. The sun is essential for the earth as it gives the earth energy which we (require 1) for the existence of life. The sun is said to have the same age as the solar system. In other words, scientists believe it is four and a half billion years old. The sun basically is a large sphere that glows because it contains hot gases. The (major 2) gases which make up the sun are hydrogen and helium. In other words, it has 70% hydrogen and 28% helium. It also contains other gases like carbon, oxygen and nitrogen. Further, there are other elements like silicon, neon, sulfur and magnesium. The sun is a very bright star (which 3) is four hundred times brighter than a full moon.

Part two: A) Read the following passage then choose the best answer to the questions below: (2) points each

Historians believe that Maya people of central America first learned to farm cacao plants around two thousand years ago. The Maya people took the cacao trees from the rainforests and grew them in (their 1) gardens. They cooked the cacao seeds, and then crushed them into a soft paste. They mixed the paste with water and spices to make an unsweetened chocolate drink. The explorer, Columbus, brought cacao seeds to Spain after his trip to central America in 1502. The wealthy people of Spain first enjoyed a sweetened version of chocolate drink. Later, the popularity of the drink spread throughout Europe. Chocolate (remained 2) a drink that only (wealthy 3) people could afford to drink until the 18th century. During the period known as the Industrial Revolution, new technologies helped make chocolate less costly to produce. Today, chocolate making is a big business. Many offer chocolate lovers the chance to taste chocolates grown in different areas of the world.

Part two: A) Read the following passage then choose the best answer to the questions below: (2) points each

World War One was a global conflict that took place between 1914 and 1918. Also known as the Great War or First World War. (It 1) took place mainly in Europe, but it was spread to the Middle East, Africa and Asia. Most of the war was fought using artillery (large weapons such as cannons), machine guns, and rifles. But the conflict also featured bombing attacks, the use of poison gas, and saw the introduction of (new 2) technology such as tanks, military aircrafts, and submarines. What was different about this war was the (huge 3) number of people involved. Soldiers fought and died in millions. It was expected that the entire population would help in making more weapons to support the war, but no one helped as it was expected. World War One was the first conflict that was fought on worldwide scale.

Part two: A) Read the following passage then choose the best answer to the questions below: (2) points each

More than ninety kinds of fruits, vegetables and seed crops depend on bees for reproduction. The insects gather nectar liquid from flowers. As they do this, pollen sticks to the bees. Pollen is the reproductive material of flowers. As a bee travels from plant to plant, so does the pollen. Bees are producers of natural honey. Honey can be stored, so honey sellers can wait to sell the honey when prices are up. Experts say even (crops 1) that do not require pollination can be increased with the help of bees. The quality of many crops depends on the amount of pollination they receive. Honey bees can be killed by chemical poisons, but they also have a lot of natural enemies. For example, mites (which 2) destroy hives. Tracheal mites are also a big problem; they live in the breathing tubes of bees. Wax moths are insects that eat wax in the hives. Bacterial diseases also affect colonies and can (attack 3) and destroy bees.

Part two: A) Read the following passage then choose the best answer to the questions below: (2) points each

Wind power is the energy, such as electricity that is generated directly from the wind. (It 1) is considered a renewable energy source because there is always wind on the earth, which means we aren't using up the wind when we make energy from it. Wind power also does not cause (pollution 2). In order to make electricity from wind, energy companies use (large 3) windmills called wind turbines. They are called like this because they use turbine generators to generate the electricity. Wind turbines are really big structures. The tower itself is typically between 200 and 300 feet tall. Wind turbines work the opposite of a fan. Instead of using electricity to turn the blades to make wind, it uses the wind to turn the blades to make electricity. If there isn't any wind, then no energy will be generated by wind turbines. However, engineers do a lot of measurements and calculations to find out the best areas to place the wind turbines. The wind won't be blowing all the time, but the important thing is how much the wind blows on average.

Many food historians believe that onions were originated in central Asia. Other researchers suggested that onions were first grown in Iran and west Pakistan. It was believed that predecessors(discovered 1)and started eating wild onions very early. Very likely, this humble vegetable was basic in the prehistoric diet. More researchers agreed that onions had been planted for 500 years or more. Since onions grew wild in various regions, they might have probably been eaten for thousands of years all over the world. Onions may have been one of the earliest planted crops. They were less to be spoiled or destroyed than other foods of the time, easy to grow, and could grow in a variety of soils and climates. In addition, onions were (useful 2) for storage when food might have been little or not available. While the place and time of the onions origin is still a mystery, many documents from very early times describe its importance as a kind of food and (its 3) use in art, medicine, and mummification.

Part two: A) Read the following passage then choose the best answer to the questions below: (2) points each

The black stork is a beautiful bird with long straight legs, sharp red beaks, large wings and shining necks. These birds are widespread, however, spotting them on populated lands might be difficult as they are very (shy 1). Their diet includes fish and other amphibians. They are tall creatures that usually live near rivers and lakes. They are also found to make nests on mountains and hills near good water sources. They prefer staying away from humans. They live either alone or either in pairs, avoiding contact with humans. They live up to 18 years on their own in the wild. However, there are records of these birds living up to 36 years. The black stork, Ciconia nigra, is the loudest stork family, even louder than the white stork. However, they are quieter than other birds in general. Baby storks are called chicks or hatchlings. The food given to chicks is first eaten by the parents themselves, and then (thrown 2) in (their 3) mouths.

Part two: A) Read the following passage then choose the best answer to the questions below: (2) points each

Coffee trees are native to eastern Africa and areas of Arabian Peninsula. Coffee was first grown and traded in the 15th century. Back then, most coffee came from Yemen. Before long, coffee was in high demand all over the Middle East. By the seventeenth century, coffee had been introduced to Europe. European traders (started 1) bringing coffee plants to other parts of the world. By the 20th century, most of the world's production came from Central and South America. Today, Brazil is the largest producer of coffee in the world. Coffee trees can (grow 2) up to nine meters high, but they cut short for production. These trees have shiny dark green leaves that grow on opposite sides of each other on a stem. The plant produces a fruit that is called a coffee cherry. When the coffee cherries are ripe and ready to be picked, (they 3) are red and firm. Inside the fruits are green coffee beans. After these beans are roasted at high temperature, they are ready to be made into a drink.

Part two: A) Read the following passage then choose the best answer to the questions below: (2) points each

A mountain is a landform that rises high its surroundings. The groups of mountains are called ranges. The lines of ranges form mountain belts. Some mountains were formed by the activity of volcanoes. Scientists believe that most volcanic mountains are made of rocks that melted deep with the earth. The rock rose through the earth's surface, or crust; it then flowed onto the surface in the form of lava. The lava, along with dust, build-up to form mountains. Volcanic mountains are typically steep and cone shaped. Other mountains were formed by movements within earth's surface, or crust. Earth's surface is (divided 1) into huge pieces called plates, which (move 2) very slowly. The continents sit on top of the plates and move with them. At times the plates hit each other, forcing the rock upward. The Himalayas of Asia are an example of this type of mountain chain. (They 3) were formed when a plate carrying India was collided with the Asian plate.

Part two: A) Read the following passage then choose the best answer to the questions below: (2) points each

Diabetes is a condition when your body is not (able 1) to turn the food you eat into energy. There are two types of diabetes. Type 1 is a condition that happens when the immunity system attacks the cells in your pancreas that make insulin. Type 2 is when the cells put up a wall and do not let insulin in. Insulin is something called hormone, (which 2) is a chemical message in your body. (Without 3) insulin, the food you eat cannot get into your cells, and instead of that, food stops in your blood, making your blood sugar high. For the people with type 1 diabetes, insulin is required every day to stay alive. About five to ten percent of people with diabetes have type 1. For people with type 2 diabetes, the body starts working harder to make more insulin, and over time, it stops making it all together. The people with type 2 diabetes need insulin just like with type 1. About 90 percent of people with diabetes have type 2.

Part two: A) Read the following passage then choose the best answer to the questions below: (2) points each

The Black Death was a plague that killed many people. It first showed up in Europe in October 1347. Plague was one of the most deadly diseases. It was a disease that came from rodents and fleas, but it spread (quickly 1) among people who were in contact with the infected person. It spread quickly from person to person even if people were healthy. Some towns shut themselves down and sealed their gates, so no one could come in or out. The authorities didn't know what to do with the dead bodies, so (they 2) just piled them up in carts and let them (lying 3) there. They told people to stay at home and not to talk to anyone since they might get sick. It was said that the disease came on a ship from Asia. It had people on board too, but also rats. The rats carried the Black Death with them. The bacterium responsible for the Black Death is called Yersinia Pestis. Other animals that could carry the plague were cats and dogs.

Part two: A) Read the following passage then choose the best answer to the questions below: (2) points each

Diabetes is a condition when your body is not (able 1) to turn the food you eat into energy. There are two types of diabetes. Type 1 is a condition that happens when the immunity system attacks the cells in your pancreas that make insulin. Type 2 is when the cells put up a wall and do not let insulin in. Insulin is something called hormone, (which 2) is a chemical message in your body. (Without 3) insulin, the food you eat cannot get into your cells, and instead of that, food stops in your blood, making your blood sugar high. For the people with type 1 diabetes, insulin is required every day to stay alive. About five to ten percent of people with diabetes have type 1. For people with type 2 diabetes, the body starts working harder to make more insulin, and over time, it stops making it all together. The people with type 2 diabetes need insulin just like with type 1. About 90 percent of people with diabetes have type 2.

Part two: A) Read the following passage then choose the best answer to the questions below: (2) points each

A weapon is an object used to harm or kill living creatures or to (destroy 1) property. Individual people and armed forces use weapons to defend themselves or to attack an enemy. People use weapons for hunting, also. The first weapons were things such as stones and wooden clubs, which are solid pieces of wood. Early people used such objects to protect (themselves 2) and to hunt for food. In the mid-1400s the Spanish invented the first gun which was called harquebus. Then a largest gun called a musket, replaced the harquebus in the 1500s. The first pistols, or handled guns, also came into use at this time. In the mid-1800s, the first successful machine guns also began to be made. Machine guns quickly fire many bullets in a row. The deadliest weapon ever used was the atomic bomb, a kind of nuclear weapon. At the end of World War 2, the United States dropped two atomic bombs on Japan. More than 100.000 Japanese were killed. Today armed forces continue to use guns, bombs and other (modern 3) weapons.

Part two: A) Read the following passage then choose the best answer to the questions below: (2) points each

DNA is the material that carries all the information about how a living thing will look and function. For example, DNA in humans determines things as what color the eyes are and how the lungs work. Each piece of information is carried on a different section of DNA. These sections are called genes. DNA is short for deoxyribonucleic acid. It is in every cell of every living thing. DNA is found in structures of the cell called chromosomes. Both DNA and chromosomes are tiny. Scientists need to use very powerful microscopes to see (them 1). DNA helps to keep the body functioning properly and helps cells to make the substances called proteins, which the cells need to live. DNA also allows (living 2) things to reproduce. The genes in DNA pass along physical traits from parents to children. Sometimes there are mistakes in DNA; these (mistakes 3) are called mutations, which may cause diseases and other problems.
